Blog

The Einstein Toolkit consists of diverse software components contributed by many **different people**. We welcome all contributions from bug reports, feature requests, patches, to documentation and software for the Einstein Toolkit.

A driving principle of the Einstein Toolkit is that it should be directly and reliably useful for research and education. This requirement involves much more than simply making software available for download, and we have the following requirements for software in the Einstein Toolkit:

- Components should be of sufficient quality to be used for peer-reviewed and published science. This includes a basic standard of software engineering, documentation of the software including algorithms and methods, tutorials and examples, and self-tests to demonstrate that the software works correctly.
- To focus development and support, optimize resources, and provide best practises, the Einstein Toolkit components should be of current interest to the community.
- All components must be distributed under an **open source licence** so that others can use these components without restrictions (except as mandated by scientific integrity), can modify and improve them as necessary, and can pass on these modifications to their collaborators as they see fit.

Note that the Einstein Toolkit is not aiming to provide a single implementation. The inclusion of alternative components providing the same or similar functionality is welcomed. Further, software does not have to use or be associated with either Cactus or 3D time evolutions. On the contrary, we would love to have tools for pre- and post-processing simulation data, 1D or 2D simulation codes, or visualisation helpers.

HOW TO CONTRIBUTE NEW SOFTWARE

COMPONENTS

New software components need to satisfy the general requirements listed above. In addition, a few measures are necessary to allow for effective integration, use, and support:

- Components can be hosted in repositories at einsteintoolkit.org, or can be hosted elsewhere. If hosted at einsteintoolkit.org the authors specify who should have write permissions to the repository. If hosted elsewhere, components must be reliably and conveniently publicly accessible. If a server becomes permanently unavailable, they must be moved (e.g. to einsteintoolkit.org) to remain accessible.
- Several times a year, a new version of the ET will be released. These releases consist of snapshots of all components. These releases need to be coordinated. This involves coordination in ensuring that examples and test cases are up to date, creating tags or branches, and avoiding disruptive changes during the release process.
- Einstein Toolkit components are developed in an open manner. This means that changes to a component should not surprise the community, and that patches or corrections requested by the Einstein Toolkit maintainers should be considered in a timely manner.

The current working procedure for contributions is:

1. Author(s) contacts the Einstein Toolkit consortium (e.g. through the users or maintainers mail lists) about software that they intends to contribute
2. Discussions take place between the maintainers and author(s) to discuss issues above.
3. If software will be hosted by the Einstein Toolkit is it put into an "incoming" repository.
4. The maintainers review the software, and present their recommendation to the whole Consortium to decide if the software becomes a component of the development version of the toolkit.
5. At the next release, the component is released as part of the toolkit. Credits for the Einstein Toolkit are updated to reflect any additional contributors.

The Einstein Toolkit has been supported by NSF 0903973/0903782/0904015 (CIGR), 0701566/0855892 (XiRel), 0721915 (Alpaca), 0905046/0941653 (PetaCactus/PRAC).
